Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          780
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S) is involved in the synthesis of beta-CPA, from cyclo-acetoacetyl-L-tryptophan and dimethylallylpyrophosphate, by its homology to a dimethylallyltyptophan synthase (DMAT-S) from Claviceps purpurea. Aspergillus host cells having a modification in the DCAT-S gene, leading to reduced or eliminated toxin production, are useful for expression of heterologous polypeptides of interest. Other toxins which may be reduced or eliminated comprise Kojic acid, 3-nitropropionic acid, emodin, etc. The DCAT-S gene can be used to identify and disrupt similar genes in other filamentous fungal host strains such as Trichoderma, Penicillium
                                                                                                                                                                                                                                               9

The present invention describes a mentoon for monitoring differential expression of genes in a first filamentous fungal (F) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (BST). The BSTs are used in the methods for monitoring differential expression of genes in one or more second filamentous fungal cells. Monitoring the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene cop products to facilitate analysis of the results. AAF07478 to AAF11247 coproducts to facilitate analysis of the results. The invention relates to a polynucleotide having any of 6006 specific sequences (ABZ50888-ABZ56893), which are expressed by a fungus under specific culture conditions including, one or more of eutrophic, olid, early germination, alkaline, high temperature, low temperature or maltose culture or polynucleotides stringently hybridising to these sequences. The polynucleotides are useful for monitoring the progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungus contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                              ò

DNA encoding dimethylallyltryptophan synthase (Dmaw) version #1.

(first entry)

08-MAY-2002

ABK15520;

ABK15520 standard; DNA; 1347 BP.

```
Lectrons are secured and secured and secured continued and secured continued and secured continued and secured continued and secured secured continued and secured sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding dimethylallyltryptophan synthase (DmaW molecule) from fungi that are symbionts of commercially important grasses, useful to engineer ergot alkaloid-deficient symbionts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Echinodothis, Atkinsonalla, Myriogenospora, Neotyphodium, and Parepichloe, or natural or induced mutants. A knockout construct of (I) or antisense construct is useful for engineering ergot alkaloid-deficient fungal symbionts (endophytes of plants). This sequence encodes a dimethylallyltryptophan synthase (dmaW) described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  152
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             153 GCCGGCTATGATGTTCACGCACAGTACAAGTTCCTCTGTATCCACCGTGAGGTCATCATC 212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      69

The invention describes an isolated dimethylallyltryptophan synthase (dmaw) nucleic acid (1). (1) is a Dmaw sequence from epiphyte fungi (Nectyphodium coenophialum symbiont of commercially significant grasses and is useful for expressing Dmaw in a cell by recombinant techniques. C and is useful for expressing Dmaw in a cell by recombinant techniques. C plants used in forage, pasture, turf, land reclamation and soil conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (1) in a host fungal cell conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (1) in a host fungal cell so that the copy number of mRNA derived from transcription of the nucleic acid molecule is increased, allowing the host fungal cell to grow under appropriate growth conditions, thus causing increased production of ergot alkaloid. Probes derived from (1) are useful for increased production of ergot or analogic probes derived from (1) are useful for amplifying segments of Dmaw from fungi in family Clavicipitaceae. (1) is also useful for identifying related sequences such as from Balansia, Balansiopsis, cof Dmaw from fungi in family Clavicipitaceae. (1) is also useful for contributions and construct is useful for engineering ergot alkaloid-deficient fungal symbionts (endophytes of plants). This sequence encodes a contraction of mathylallyltryptophan synthase (dmaw) described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     synthase (DmaW

and is useful for expressing Dmaw in a cell by recombinant techniques.

(I) is also useful for: identifying endophytes e.g. from commercial plants used in forage, pasture, turf, land reclamation and soil conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (I) in a host fungal cell conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (I) in a host fungal cell contained from it anscription of the mucleic action of corp. number of mRNA derived from it can expect the growth conditions, thus causing increased production of ergot alkaloid. Probes derived from (I) are useful for identifying neotyphodium or Epichloe that lack Dmaw and therefore are unlikely to produce ergot alkaloids. The primers are useful for amplifying segments of Dmaw from fungi in family Clavicipitaceae. (I) is also useful for identifying related sequences such as from Balansia, Balansiopsis, contentifying related sequences such as from Balansia, Balansiopsis, contentifying related sequences such as from Balansia, Balansiopsis, contentifying to natural or induced mutants. A knockout construct of (I) contentifying such and symbionis (endophytes of plants). This sequence encodes a construct is useful for engineering ergot alkaloid-deficient incoming in the method of the invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ņ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         450

CC The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes communication differential expression of genes from FP cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes from FP cells adapt to changes in culture communicated strucks, spore morphogenesis, recombination, metabolic or study how FP cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF01748 to AAF11247

C represents ESTs from Fusarim venenatum, AAF11248 to AAF11247

C SETS from Aspergillus niger; AAF11853 represents ESTs from ASPERGING C Trichoderma reesei, which are all specifically claimed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             189

The invention describes an isolated dimethylallyltryptophan synthase

(dmaw) nucleic acid (I). (I) is a Dmaw sequence from epiphyte fungi
Neotyphodium coenophialum symbiont of commercially significant grasses

and is useful for expressing Dmaw in a cell by recombinant techniques.

(I) is also useful for: identifying endophytes e.g. from commercial
plants used in forage, pasture, turf, land recolamation and soil

conservation that contain or lack a Dmaw gene and producing increased

amount of ergot alkaloids involving expressing (I) in a host fungal cell
so that the copy number of many derived from transcription of the nucleic
appropriate growth conditions, thus causing increased production of ergot
alkaloid. Probes derived from (I) are useful for identifying Neotyphodium

or Acremonium or Epichloe that lack Dmaw and therefore are unlikely to
produce ergot alkaloids. The primers are useful for amplifying sequents
of Dmaw from fungi in family Clavicipitaceae. (I) is also useful for
identifying related sequences such as from Balansiopsis,
Echinodothis, Atkinsonella, Myriogenospora, Neotyphodium, and
Parepichloe, or natural or induced mutants. A knockout construct of (I)
produce ergot alkaloids in synthase (dmaw) described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                  /product= "dmaW" /note= "bimethylallyltryptophan synthase. This sequence contains introns, the position of which are not detailed in the specification"
                                                                                                                                                                                           conservation;
                                                                                                                                                                  Dimethylallyltryptophan synthase, dmaW, epiphyte fungus; symbiosis; endophyte; forage; pasture; turf; land reclamation; soil conservation ergot alkaloid; Neotyphodium; Acremonium; Epichloe; Clavicipliaceae; Balansia; Balansiopsis; Echinodochis; Akkinsonella; Myriogenospora; Neotyphodium; Parepichloe; knockout; antisense technology; gene; ds.

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (BST). The BSTS care used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the companisms to be improved. New genes may be discovered, of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and companisms to be improved. New genes may be discovered. Or gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, advantages over genomic or random CDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene conducts to facilitate analysis of the results. The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     one gene involved in plant resistance or response for conferring resistance or tolerance to a plant viral infection by determining or detecting plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             256 GGAAGAGTCATCTCACACGCTTCGGACTTCCTTTCGAGCTGAGCTTCAATTACTCCAAAT

셤 ò , G δ 셤 ò g involved in plant resistance or response to pathogenic infection. Mi comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible in compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention. 1; t t GAIGGCGGGGCCCGCTAIGAIGIICACGCACAGIACAAGIICCICIGIAICCACCGIGA 202 442 GYMSRMAMMYKKMYWYRGYKGWKRGWWAGRMMRSMCRWSKACYYWRWRMWRWTRRRRWA 376 323 ACGGTTTGCATTCGAGCCCCTCGGTTCCCTGACGGAACGAAGGATGATGCATTCAACAC 382 response TCATCTCACACGCTTCGGACTTCCTTTCGAGCTGAGCTTCAATTACTCCAAATCACTACT SCGRSGCGRRSAYSRYYGTSRKYGTYKKMTYYSASRC--MRAYMTTSYSWACSSYTWCRS GGTCATCATCCCGGCGTTGGGTCCATACCCAGAAAAGGGTCAGCCCATGCACTGGAAGAG KRESIMIWKIMIRKIMIRRSYGWYSWSYKMWCTAYKKSYYSRWCYMYRGGGWRGATRYWGR ATGGTTCGATCATTTCACTAAAGCATTGGTCGTTTCGGAGGAAGAGGCTCGGACTCTGCT CCAGGCAATCAGGCCTGTTCTCCAGGACCTCAAGGCCATGGTTCCAGGGCTTGACCTGGA Gaps Identifying at least one gene involved in plant resistance or respathogenic infection for conferring resistance or tolerance to a bacterial, fungal or viral infection by determining or detecting ΰ 5 Zou Sequence 2000 BP; 336 A; 265 C; 284 G; 363 T; 0 U; 752 Other; DB 7; Length 2000; Hon SA, Ho Zhu T, Indels Goff. The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated collypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological capantway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a Zyskind JW; Xu HH; New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs. The invention relates to an isolated nucleic acid molecule (I) comprising a mucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether profitestion of the sequence ancer; (b) monitoring the progression of prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit ing prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker ò 1190 CGCAAATCACCTGCAGGCGTGGATCTCCTTTTTCAAAGGGGAAAAAACCGTACATGAG 1249 233 cecadadeacererregrificadadadererrirececadeadadadearearrecagra 292 1250 TGTGTACCTCCATACCTTCGAAGCGTTCAGTGCTGCTGCCCAGGAGGTGGCTATGTGT 1307 293 GAGGCTTCTTCAAAGTCTCGAAGCCTTCAAAGATGTCCCCCCCGGGGGTGGTTCTTTT 350 Monkey; calcium-sensing receptor; bacteria; fungus; protozoa; viral; infection; HIV-1; HIV-2; human immunodeficiency virus; pain; cancer; diabetes; obesity; anorexia; bulimia; Parkinson's disease; stroke; acute heart failure; hypotension; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; asthma; allergy; benign prostatic hypertrophy; migraine; vomiting; psychotic; neurological disorder; anxiety; schizophrenia; manic depression; depression; delirium; demonia; severe mental retardation; dyskinesia; Huntington's disease; Gilles de la Tourette's syndrome; vaccine; ds. The sequence represents the coding sequence of Cynomolgous monkey calcium sensing receptor nucleic acid and and polypeptide are useful for treations. Fundal, fundal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancer, diabetes, obseity, anorexia, bullmia, Parkinson's disease, acute hart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allestgies, banian prostatic hypertrophy, migratine, vomiting, psychotic and neurological disorders including anxiety, schizophrenia, manic depression, depression, delirium, dementia and severe mental retardation, and dyskinesias, such as Huntington's disease or Gilles de la Tourette's syndrome. The polypeptide is useful for structure-based design of agonist, antagonist or inhibitor of the calcium-sensing receptor. The DNA sequence is useful for chromosome localisation studies. The polypeptide and nucleic acid are also useful as vaccines. (Updated on 1-SEP-2003 to standardise OS field) Novel Cynomolgous Monkey Calcium-Sensing Receptor polypeptides are useful for treating infections, pain, cancer, diabetes, obesity, asthma, schizophrenia, hypertension, urinary retention, Parkinson's disease and Claim 1; Page 27-28; 38pp; English. stroke

New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 30494; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the folia antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated collypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an openon required for proliferation or the activity of a gene in an openon required for proliferation or that inhibits cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling or climan or servations or collection of an organism. The antisense nucleic acids are useful for the printed specification in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target of nucleication, but was obtained in cellectonic format directly from Who at the printed specification, but was obtained in cellectonic completed.

Sequence 3, Application US/09518657
Patent No. 6355188
SEGUENAL INFORMATION:
APPLICANT: Wang, Jinghong to Title OF INVENTION: Endophyte Ergot Alkaloid Synthetic Compounds
TITLE OF INVENTION: Endophyte Ergot Alkaloid Synthetic Compounds
TITLE OF INVENTION: Which Encode Therefor and Related Methods
FILE REFERENCE: P-1060
CURRENT APPLICATION NUMBER: 60/125,490
EARLIER APPLICATION NUMBER: 60/125,490
SARLIER APPLICATION NUMBER: 60/125,490
NUMBER OF SEQ ID NOS: 6
SOFTWARE: PatentIn Ver. 2.1
SEQ ID NO 3
LENGTH: 1353
TYPE: DNA
                                                                                                                                                                                                                                                                                                                                                                                1079
